FAIR AND CLEAR PRICING

You can keep prices low for your clients and while avoiding unexpected costs by removing pricing and bill complexity.

SIMPLE AND FAST SETUP

Our clean user experience and extensive API documention mean your development teams can get sites up quickly and efficiently.

How do partners use DigitalOcean for website hosting?

Droplets
Four types of Droplet configurations that provide you with the flexibility to build and scale your website.

CDN w/Spaces
Reduce your page load times while lowering your band-width and infrastructure costs.

Load Balancer
Distribute traffic across your servers and leverage web content caching to speed up response times.
Floating IP
Redirect network traffic between any of your Droplets within the same datacenter.
Managed Databases
Separate your web server from your database backend for faster websites.

Marketplace
Build faster and smarter with a diverse catalog of 1-Click Apps incluing WordPress, cPanel and Plesk.

In the minimal configuration above, a single Load Balancer distributes website requests between two web droplets for added redundancy ensuring your web-site stays up even if there is a sudden spike in traffic.

In a slightly more involved setup, the website Drop-lets offload static assets like JavaScript and images to Spaces object storage and use Spaces CDN for fast, globally-distributed delivery. In addition, the data layer is decoupled from the web layer, and website per-sistent data is stored in a redundant and secure Man-aged Databases cluster.
